Study the Biological Activities of Tribulus Terrestris Extracts

Abstract—In this study the extracts of the Iraqi herb Tribulus terrestris (Al-Hassage or Al-Kutub) was done by using of polar and non polar solvents, then the biological activity of these extractants was studied in three fields, First, the antibacterial activity (in vitro) on gram positive bacteria (Staphylococcus aureus), and gram negative bacteria (E. coli, Proteus vulgaris, Pseudomonas aeruginosa, and Klebsiella), all extracts showed considerable activity against all bacteria. Second, the effect of extracts on free serum testosterone level in male mice (in vivo), the alcoholic, and acetonitrilic extracts showed significant (P < 0.05) increase in free serum testosterone level, and we found that the extracts contained compounds with less genotoxic effects in mice germ cells. 3rd, to study the effect of methanolic extract of T. terrestris in diabetes management.

Keywords—Genotoxic, germ cells, tribulus terrestris, testosterone.

I. INTRODUCTION

Tribulus terrestris is a natural herb used for treating many diseases like hypertension[1]. It is a member of the Zygophyllaceae family, and an annual herb found in many tropical and moderate areas of the world, including the U.S. and Mexico, the Mediterranean region, and throughout Asia[2]. Tribulus terrestris, is also known as Puncture Vine, it contains steroidal saponins, and act as a natural testosterone enhancer. Tribulus terrestris increases testosterone through increasing lutenizing hormone (LH). There is good confidence that Tribulus terrestris is useful as a sexual enhancement herb[3]. In Iraq T. terrestris is used in folk medicine as tonic, aphrodisiac, analgesic, astringent, stomachic, anti-hypertensive, diuretic, lithon-triptic and urinary anti-infectives[4,5].

Mainstream medicine is increasingly receptive of the use of antimicrobial and other drugs derived from plants, as traditional antibiotics become ineffective and because of the rapid rate of plant species extinction. There is a feeling among natural-products chemists and microbiologists alike that the multitude of potentially useful phytochemical structures which could be synthesized chemically is at risk of being lost irretrievably[6].

The aim of this work was to study the biological activity of the Iraqi herb Tribulus terrestris as antibacterial and testosterone enhancer moreover study genotoxic effects in germ cells of mice.

II. EXPERIMENTAL

A. Extraction Procedure

Tribulus Terrestris were collected from natural habitats during flowering. Air dried plant sample rinsed with water and dried. After evaporation of the solvent, the residues were powdered (250 g) and extracted with 500ml, 70% ethanol (or methanol, or acetonitril, or hexane) in a soxhlet apparatus and the extracts were evaporated to dryness by a rotary evaporator.

B. Agar Diffusion Assays

Different strains of bacteria were used which are: Escherichia coli, Pseudomonas aeruginosa, Klebsiella, Proteus vulgaris and Staphylococcus aureus. All strains were collected from Biochemical division, Department of applied science, University of Technology. The identity of all the strains were confirmed. A bacterial suspension was prepared and added to the sterilized medium before solidification. The media with bacteria was poured into sterilized Petri dishes under aseptic condition. Different weights of the extractants (alcoholic, mthanolic, acetonitrilic, or hexane, 0.02 M) in N,N-dimethylformamide (DMF) solvent were placed on the surface of the culture and incubated at 37 °C for 24 hours. After incubation the average of inhibition zones was recorded[7-8].

C. Determination of Free Serum Testosterone

The level of free serum testosterone was measured according to Enzyme-linked immunosorbant assay [9].

D. Animals

Healthy, adult 20 male mice weighing 25-30g, aged 2-3 months were used in this study. The animals had free access to a standard commercial diet and water, they were kept in rooms maintained at 25-27°C. The animals were divided randomly into different groups; each group consisted of six male mice. First Step: Control group 2 male mice orally treated with distilled water (2 ml/kg) three times per week for 45 days.
Second Step: Group 2 (3 male mice) orally treated with 70% alcoholic extract 20 mg / kg body weight three times per week for 45 days.

Third Step: Group 3 (3 male mice) orally treated with methanolic extract 20 mg / kg body weight three times per week for 45 days. Forth Step: Group 4 (3 male mice) orally treated with acetonitrilic extract 20 mg / kg body weight three times per week for 45 days. Fifth Step: Group 5 (3 male mice) orally treated with hexanic extract 20 mg / kg body weight three times per week for 45 days. Sixth Step: Group 6 (3 male mice) orally treated with Bulgarians Tribulus terrestris extracts 50 mg / kg body weight three times per week for 45 days. Seventh Step: Group 7 (3 male mice) orally treated with methyltestosterone 3 mg / kg body weight three times per week for 45 days.

III. RESULTS AND DISCUSSION

A. Antimicrobial Activity of Tribulus Terrestris Extracts

The antibacterial activity of T. terrestris varies depending on the origin and plant's part used. The ethanolic extract of the fruit and leaves of Indian herb has activity against E. coli and S. aureus, but ethanolic extract of T. terrestris from Yeman has no detectable anti-bacterial activity, against any of the reference bacteria. The methanolic extract of the same herb grown in Iran has anti-bacterial activity. The activity is reported due to spiroasaponins, present in the herb[11].

1: The determination of the MIC

(Minimum inhibition concentration) by means of the agar diffusion assay (Table I) showed that 4 plant extracts tested exhibited an antimicrobial effect against Gram positive bacteria, Staphylococcus aureus and Gram negative, Klebsiella, Proteus vulgaris, Pseudomonas and E. coli.

2: The Antibacterial activity of T. terrestris extracts

The antibacterial activities of the plant extracts were evaluated by measuring the inhibition zone observed around the tested materials.

In agar diffusion assay, the hexanoic and methanolic extracts of the plant showed considerable activity against all tested bacteria (Table II).

B. Biological Activity on Male Mice

1: Effect T. terrestris extracts on free serum testosterone level in male mice

T. terrestris has stimulating effect on spermatogenesis by increase in the amount of Luteinizing Hormone (LH) produced by Pituitary gland, which stimulate the secretion of male hormone 'Testosterone', resulting in significant improvement in quality and quantity of sperm. [12-15]. In the present work tribulus terrestris extracts show increasing of free serum testosterone level in male mice (Table III).

2: Cytotoxic activity of T. terrestris extracts

T. terrestris of different regions (Bulgaria, China and India) and different parts of plants (stem and fruit) shows that only the spiro compounds exhibit remarkable activity. The inhibitory effect of saponin mixture from Chinese origin on Bcap37 breast cancer cell has potent inhibitory effect. [16].

The spontaneous frequency of chromosomal aberration (CAs) in mous germ cells was (0.18 ± 0.06) which represents a control Table IV. The results of this experiment indicate that (0.2, 0.4, 0.8) mg/ mL of methyltestosterone can increase CAs frequencies (Ring chromosome, chromosome break and chromatid break) more than methanolic, ethanolic extracts and also tribestane which reached to (0.36, 0.42, 0.44). These results were significantly different (P<0.05) from the control.

The chromosomal aberration induction by methyltestosterone is not fully understood. Suggested that the inhibition of chromosomal protein synthesis might cause a weakening of chromosomal backbone and subsequent chromosomal aberration [17] or may be related to the testicular damage as manifested by reduced testicular volume, elevated FSH and LH protein[18]. Several chemotherapeutic such as fludarabin, cyclophosphamide can cause these damage[19].
The extracts of Iraqi *Tribulus terrestris* after seven days of treatment by alcoholic extract, water extract, organic extract and methanolic extract experienced a significant decrease in CAs compared to control. These extracts contain many compounds which may increase the activity of the detoxification enzymes such as superoxide dismutase and glutathione-S-transferase. The decrease observed in CAs could be due to the antioxidant activity of these extracts. The methanolic extract of *T. terrestris* resulted in a significant decrease in blood glucose level (43±4.1 and 41±3.4) after three weeks of treatment. The levels of liver enzymes, particularly alanine aminotransferase (ALT), were significantly reduced after treatment with methanolic extract of *T. terrestris*.

### IV. Conclusion

The solvent extracts of *T. terrestris* showed good antibacterial activity against Gram positive and Gram negative bacteria. Methanolic extract showed very good activity as a testosterone producer in serum tested animals. In addition, the methanolic extract of *T. terrestris* produced significant decrease in blood glucose level of diabetic mice.
