On fuzzy weakly-closed sets

J. Mahanta and P.K. Das

Abstract—A new class of fuzzy closed sets, namely fuzzy weakly closed set in a fuzzy topological space is introduced and it is established that this class of fuzzy closed sets lies between fuzzy closed sets and fuzzy generalized closed sets. Alongwith the study of fundamental results of such closed sets, we define and characterize fuzzy weakly compact space and fuzzy weakly closed space.

Keywords: Fuzzy weakly-closed set, fuzzy weakly-closed space, fuzzy weakly-compactness.

MSC: 54A40, 54D30.

I. INTRODUCTION AND PRELIMINARIES

It is known that the different notions of topology are defined in terms of the open sets, which can also be replaced by either closed sets, or closure or interior, or neighborhood system. Among these again open sets and closed sets are very closely linked and are indispensable in the study of the topological notions. This has led to several generalizations of closed sets ([1], [4], [5], [11], [12], [16], [17], [21] etc.) which in turn have provided several new properties of topological spaces.

In this study, we consider fuzzy topological space (FTS) in Chang’s sense [8], by \( xcl(A) \) we mean \( x \)–closure of \( A \) where \( x \in \{\alpha, s, p, sp, g^s\} \). We give below a few definitions and results which are required for our study and refer the readers to [18] for the terms not defined here.

Definition 1.1. A family \( \{A_\lambda | \lambda \in \Lambda\} \) of fuzzy subsets of a set \( X \) has the finite intersection property (FIP) if the intersection of the members of each finite subfamily of \( \{A_\lambda | \lambda \in \Lambda\} \) is nonempty.

Definition 1.2. [10] A collection of fuzzy subsets \( \Gamma \) of an FTS \( X \) is said to form a fuzzy filterbase iff for every collection \( \{A_j | j = 1, 2, ..., n\}, \bigcap_{j=1}^{n} A_j \neq 0_X \).

Definition 1.3. A fuzzy set \( A \) of an FTS \( (X, \tau) \) is said to be:

i) [6] fuzzy \( \alpha \) closed (simply \( F_\alpha \) closed) if \( cl(Int(cl(A))) \leq A \).
ii) [6] fuzzy pre-closed (simply \( Fp \) closed) if \( cl(Int(cl(A))) \leq A \).
iii) [2] fuzzy semi-closed (simply \( Fs \) closed) if \( cl(Int(cl(A))) \leq A \).
iv) [3] Generalized closed \( (Fg) \) closed fuzzy set iff \( cl(A) \leq U \) whenever \( A \leq U \) and \( U \in \tau \).

v) [15] Semi-generalized closed fuzzy set \( (Fsg) \) closed if \( scl(A) \leq U \) whenever \( A \leq U \) and \( U \in \tau \).
vi) [19] \( \alpha \)–generalized closed \( (Fg\alpha) \) closed fuzzy set if \( ocl(A) \leq U \) whenever \( A \leq U \) and \( U \in \tau \).
vii) [19] Generalized \( \alpha \)–closed \( (Fg\alpha) \) closed fuzzy set if \( ocl(A) \leq U \) whenever \( A \leq U \) and \( U \in \tau \).
viii) [20] Semi-pre-generalized fuzzy set \( (Fspg) \) closed if \( spcl(A) \leq U \) whenever \( A \leq U \) and \( U \in \tau \).
ix) [7] Pre-generalized fuzzy set \( (Fpg) \) closed if \( pcl(A) \leq U \) whenever \( A \leq U \) and \( U \in \tau \).
x) [9] Generalized semi closed \( (Fgs) \) closed fuzzy set if \( scl(A) \leq U \) whenever \( A \leq U \) and \( U \in \tau \).
xii) Generalized-pre closed \( (Fgp) \) closed fuzzy set if \( pcl(A) \leq U \) whenever \( A \leq U \) and \( U \in \tau \).
xiii) Generalized-semi-pre closed \( (Fgsp) \) closed fuzzy set if \( spcl(A) \leq U \) whenever \( A \leq U \) and \( U \in \tau \).
xiv) [14] g\( s^* \) closed fuzzy set if \( scl(A) \leq U \) whenever \( A \leq U \) and \( U \in \tau \).

The complements of the above closed sets are known as the respective open sets.

Proposition 1.4. In an FTS \( (X, \tau) \) the following results hold:

i) [3] Every fuzzy closed set is \( Fg \) closed.
ii) [15] Every \( Fs \) closed set is \( Fsg \) closed.
iii) [19] Every \( Fg \) closed set is \( Fg\alpha \) closed.
iv) [7] Every \( Fp \) closed set is \( Fpg \) closed.
v) [20] Every \( Fsp \) closed set is \( Fspg \) closed.
vi) [14] Every \( Fg \) closed set is \( Fgs \) closed.

The converse of the each of the above results are not necessarily true.

Proposition 1.5. ([2], [6], [22]) In an FTS \( (X, \tau) \) the following results hold for different types of open sets:

i) Every fuzzy open set is \( Fg \) open.
ii) Every \( Fg \) open set is both fuzzy semiopen and fuzzy preopen.

iii) Every fuzzy semiopen set is fuzzy semi-preopen.

The following lemma is a direct consequence of the definitions.

Lemma 1.6. Let \( A \) be a fuzzy subset in an FTS \( (X, \tau) \). Then each of the following follows directly from the definitions:

i) \( spcl(A) \leq scl(A) \leq ocl(A) \leq cl(A) \).
ii) \( spcl(A) \leq pcl(A) \leq ocl(A) \).

II. FUZZY WEAKLY-CLOSED SETS

Weakly closed set in topological space was introduced by Sundaram et al. in [21]. In this section, we introduce fuzzy...
weakly-closed set in an FTS and study some general properties of such sets.

**Definition II.1.** Let \((X, \tau)\) be an FTS and \(A\) be a fuzzy subset of \(X\). Then \(A\) is said to be fuzzy weakly-closed if \(cl(A) \subseteq U\), whenever \(A \subseteq U\). \(U\) is a fuzzy semi-open set in \(X\). Complement of a fuzzy weakly-closed set is fuzzy weakly-open set.

**Example II.2.** Consider the FTS \((X, \tau)\), where \(X = \{a, b, c\}\), \(\tau = \{0_X, 1_X, B\}\) and

\[
B(x) = \begin{cases} 
1 & \text{if } x = b; \\
0 & \text{otherwise},
\end{cases}
\]

Then \(F(x) = \begin{cases} 
1 & \text{if } x = a, c; \\
0 & \text{otherwise},
\end{cases}\)

is fuzzy weakly-closed, whereas

\[
E(x) = \begin{cases} 
1 & \text{if } x = a, b; \\
0 & \text{otherwise},
\end{cases}
\]

is not fuzzy weakly-closed.

**Theorem II.3.** Union of two fuzzy weakly-closed set is fuzzy weakly-closed.

**Proof:** Let \(A\) and \(B\) be two fuzzy weakly-closed sets in \(X\). Let \(U\) be a fuzzy semi-open set in \(X\) such that \(A \cap B \subseteq U \Rightarrow A \subseteq U\) and \(B \subseteq U\). Then by definition of fuzzy weakly-closed set, we have \(cl(A) \subseteq U\) and \(cl(B) \subseteq U\). \(cl(A \cap B) \subseteq U\) \(\Rightarrow \ cl(A) \cap B \subseteq U \Rightarrow A \subseteq U\) and \(B \subseteq U\) is fuzzy weakly-closed.

**Remark II.4.** Intersection of two fuzzy weakly-closed sets is not necessarily fuzzy weakly-closed.

**Example II.5.** Consider the fuzzy sets \(A, I, N, F, E\) defined on \(X = \{a, b, c, d\}\) as follows:

\[
A(x) = \begin{cases} 
1 & \text{if } x = a; \\
0 & \text{otherwise},
\end{cases}
\]

\[
I(x) = \begin{cases} 
1 & \text{if } x = b, d; \\
0 & \text{otherwise},
\end{cases}
\]

\[
N(x) = \begin{cases} 
1 & \text{if } x = a, b; \\
0 & \text{otherwise},
\end{cases}
\]

\[
F(x) = \begin{cases} 
1 & \text{if } x = a, c; \\
0 & \text{otherwise},
\end{cases}
\]

and \(E(x) = \begin{cases} 
1 & \text{if } x = a, b; \\
0 & \text{otherwise},
\end{cases}\)

Then \(\tau = \{0_X, A, I, N, 1_X\}\) is a fuzzy topology on \(X\). Here \(F\) and \(E\) are fuzzy weakly-closed sets but \(F \cap E = A\) is not a fuzzy weakly closed set.

**Remark II.6.** Arbitrary union of fuzzy weakly-closed sets is not necessarily fuzzy weakly-closed.

**Theorem II.7.** Intersection of two fuzzy weakly-open sets is fuzzy weakly-open.

**Proof:** Let \(A\) and \(B\) be two fuzzy weakly-open sets \(\Rightarrow A^c\) and \(B^c\) are fuzzy weakly-closed sets \(\Rightarrow A^c \vee B^c\) is a fuzzy weakly-closed set \(\Rightarrow (A \wedge B)^c\) is a fuzzy weakly-closed set \(\Rightarrow A \wedge B\) is a fuzzy weakly-open set.

**Remark II.8.** Union of two fuzzy weakly-open sets need not be fuzzy weakly-open.

**Remark II.9.** Arbitrary intersection of fuzzy weakly-open sets need not be fuzzy weakly-open.

**Theorem II.10.** A fuzzy set \(A\) in an FTS \((X, \tau)\) is fuzzy weakly-open iff \(U \subseteq \text{int}(A)\) whenever \(U \subseteq A\) and \(U\) is fuzzy-closed.

**Proof:** Let \(A\) be fuzzy weakly-open set such that \(U \subseteq A\) and \(U\) is fuzzy-closed \(\Rightarrow A^c \subseteq U^c\), where \(U^c\) is fs-open. Now \(A^c\) is fuzzy weakly-closed, so \(cl(A^c) \subseteq U^c \Rightarrow U \subseteq (cl(A^c))^c = \text{int}(A)\).

Conversely, assume that \(U \subseteq \text{int}(A)\) whenever \(U \subseteq A\) where \(U\) is fs-closed. Let \(A^c \subseteq V\) where \(V\) is fuzzy-open \(\Rightarrow V^c \subseteq A \Rightarrow V^c \subseteq \text{int}(A)\) (by hypothesis) \(\Rightarrow (\text{int}(A))^c \subseteq V \Rightarrow cl(A^c) \subseteq V \Rightarrow A^c\) is fuzzy weakly closed \(\Rightarrow A\) is fuzzy weakly open.

**Theorem II.11.** If a fuzzy set \(A\) in an FTS \((X, \tau)\) is both fuzzy open and fuzzy generalized closed, then it is fuzzy weakly closed.

**Proof:** Let \(A\) be an fuzzy open set which is also fuzzy-closed \(\Rightarrow cl(A) \subseteq A\) as \(A\) is a fuzzy open set containing itself. We know \(A \subseteq cl(A)\) for any fuzzy set in \(X\). Hence \(A = cl(A)\) \(\Rightarrow A\) is fuzzy closed set \(\Rightarrow A\) is fuzzy weakly-closed set.

**Remark II.12.** If \(A\) and \(B\) are two fuzzy sets such that \(A \subseteq B \subseteq cl(A)\), then \(cl(A) = cl(B)\).

**Theorem II.13.** Let \(A\) be a fuzzy weakly-closed subset of an FTS \((X, \tau)\) and suppose the fuzzy subset \(B\) is such that \(A \subseteq B \subseteq cl(A)\), then \(B\) is also fuzzy weakly-closed.

**Proof:** Let \(A\) be a fuzzy weakly-closed set and \(B\) be an fuzzy semi-open set such that \(B \subseteq U \Rightarrow A \subseteq U\). Then by definition of fuzzy weakly-closed set, we have \(cl(A) \subseteq U\) and \(cl(B) \subseteq U\). \(cl(A) \cap B \subseteq U \Rightarrow A \subseteq U\) and \(B \subseteq U\) is fuzzy weakly-closed.

**Definition II.14.** Let \(A\) be a fuzzy set in an FTS \(X\). Then fuzzy weakly-closure and weakly-interior of \(A\) (denoted by \(wcl(A)\) and \(\text{wint}(A)\) respectively) are defined as follows:

\[
wcl(A) = \bigwedge\{B \mid B\text{ is fuzzy weakly-closed set and } A \subseteq B\},
\]

\[
\text{wint}(A) = \bigvee\{C \mid C\text{ is fuzzy weakly-open set and } C \subseteq A\}.
\]

If \(A\) is a fuzzy weakly-closed set then \(wcl(A) = A\) but the converse is not necessarily true since intersection of any two fuzzy weakly-closed sets may not be fuzzy weakly-closed.

Following results are obtained from the definitions:

\[
wcl(U^c) = (\text{wint}(U))^c\text{ and }\text{wint}(U^c) = (wcl(U))^c.
\]

**III. Comparative study**

In this section, fuzzy weakly-closed set is compared with different fuzzy closed sets. Below is a diagram describing inter-relationship of fuzzy weakly closed sets and other types of fuzzy closed sets. As implications are direct outcomes of the definitions, we are omitting the proofs for the same. However, counter examples are given wherever necessary.
Example III.1. Taking the same FTS as defined in Example 2.5, we have \( N \) is a fuzzy weakly-closed set but not a fuzzy closed set.

Example III.2. For the FTS in Example 2.5,

\[
I(x) = \begin{cases} 
1 & \text{if } x = b, d; \\
0 & \text{otherwise}
\end{cases}
\]

is fgs-closed and fsg-closed set but not fuzzy weakly-closed set.

Example III.3. For the FTS in Example 2.5,

\[
G(x) = \begin{cases} 
1 & \text{if } x = a, d; \\
0 & \text{otherwise}
\end{cases}
\]

is a fg-closed set but not fuzzy weakly-closed set.

Example III.4. But taking the FTS in Example 2.5, \( A \) is a fgs-closed set but not fuzzy weakly-closed set.

Example III.5. Again for the FTS in Example 2.5, \( A \) is a fsg-closed set but not fuzzy weakly-closed set.

Example III.6. Let \( X = \{a, b, c\} \) and \( H \) be a fuzzy set on it defined by

\[
E(x) = \begin{cases} 
1 & \text{if } x = a, b; \\
0 & \text{otherwise}
\end{cases}
\]

Then \( \tau = \{0_X, 1_X, E\} \) is a fuzzy topology on \( X \). Here \( E \) is a fgsp-closed but not fuzzy weakly-closed.

Example III.7. For Example 2.5,

\[
C(x) = \begin{cases} 
1 & \text{if } x = c; \\
0 & \text{otherwise}
\end{cases}
\]

is a fgsp-closed but not a fuzzy weakly-closed set.

Example III.8. Taking the same example as Example 2.5, \( A \) is a fs-closed, fsa-closed and fg*-s-closed, \( N \) is a fsp-closed, \( C \) is fsp-closed and fg*-closed but are not fuzzy weakly-closed; on the other hand \( E \) is fuzzy weakly-closed set but not fs-closed, fsa-closed, fsp-closed and fgs-closed and

\[
J(x) = \begin{cases} 
1 & \text{if } x = c, d; \\
0 & \text{otherwise}
\end{cases}
\]

is fuzzy weakly-closed but not fsp-closed as well as fg*-s-closed.

IV. Compactness

A topological space is said to be compact if every open cover of it has a finite subcover, i.e., the property of a topological space being compact depends on open sets. As open set is generalized to weakly open set, the concept of compactness can also be generalized in the similar manner. In this section, we introduce fuzzy weakly-compactness and fuzzy weakly-closed space, which are then characterized using fuzzy filterbases.

The notion of compactness for FTS was introduced by C.L. Chang [8]. But Lowen [13] differed from this and subsequently definition for compactness by Chang is popularly known as quasi compactness.

We present below a result showing relationship of fg*-s-closed sets and the so called quasicompactness.

Theorem IV.1. Let \((X, \tau)\) be a fuzzy quasi compact topological space. If \( A \) is a fuzzy weakly-closed subset of \( X \), then \( A \) is also quasi compact.

Proof: Let \( \{U_\lambda \mid \lambda \in \Lambda\} \) be a fuzzy open cover of \( A \), i.e., \( A \subseteq \bigvee_{\lambda\in\Lambda}U_\lambda \). But \( \bigvee_{\lambda\in\Lambda}U_\lambda \) is fs-open set containing \( A \), which is fuzzy weakly-closed \( \Rightarrow cl(A) \subseteq \bigvee_{\lambda\in\Lambda}U_\lambda \). We have \( cl(A) \) is a closed fuzzy set and hence is quasi compact \( \Rightarrow \exists \) a finite subfamily \( \{U_{\lambda_i} \mid i = 1, 2, \ldots, n\} \) such that \( cl(A) \subseteq \bigvee_{i=1}^nU_{\lambda_i} \Rightarrow A \subseteq \bigvee_{i=1}^nU_{\lambda_i} \Rightarrow A \) is fuzzy quasi compact.

Definition IV.2. An FTS \((X, \tau)\) is said to be fuzzy weakly-compact iff for every family \( \{G_\lambda \mid \lambda \in \Lambda\} \) of fuzzy weakly-open sets satisfying \( \bigvee_{\lambda\in\Lambda}G_\lambda = 1_X \), there is a finite subfamily \( \{G_{\lambda_i} \mid i = 1, 2, \ldots, n\} \) such that \( \bigvee_{i=1}^nG_{\lambda_i} = 1_X \).

Example IV.3. Let \( X = [0, 1] \) and \( A_n : X \rightarrow [0, 1] \) be defined by

\[
A_n(x) = \begin{cases} 
1 & \text{if } n \text{ is odd}; \\
1 - \frac{1}{n} & \text{if } n \text{ is even.}
\end{cases}
\]
Then $\tau = \{0_X, 1_X, A_\lambda \}$, where $n \in \mathbb{N}$ is a fuzzy topology on $X$. If $\mu$ is a weakly open cover of $X$, then $1_x$ must be a member of $\mu$, otherwise there does not exist a cover of $X$. Hence $X$ is fuzzy weakly-compact.

**Definition IV.4.** A fuzzy set $U$ in an FTS $X$ is said to be fuzzy weakly-compact relative to $X$ iff for every family $\{G_\lambda \mid \lambda \in \Lambda\}$ of fuzzy weakly-open sets satisfying $\bigvee_{\lambda \in \Lambda} G_\lambda(x) \geq U(x), \forall x \in \text{Supp}(U)$, there is a finite subfamily $\{G_{\lambda_i} \mid i = 1, 2, ..., n\}$ such that $\bigwedge_{i=1}^{n} G_{\lambda_i}(x) \geq U(x)$, for every $x \in \text{Supp}(U)$.

**Theorem IV.5.** An FTS $X$ is fuzzy weakly-compact iff $X$ does not contain a fuzzy filterbase of fuzzy weakly-closed sets such that the corresponding collection of fuzzy weakly-open sets forms a cover of $X$.

Proof: Equivalently we show, an FTS $X$ is not fuzzy weakly-compact iff $X$ contains at least one fuzzy filterbase of fuzzy weakly-open sets such that the corresponding collection of fuzzy weakly-open sets forms a cover of $X$.

Let $X$ be an FTS which is not fuzzy weakly-compact $\Rightarrow \exists$ a fuzzy weakly-open cover of $X$, say $\{A_\lambda \mid \lambda \in \Lambda\}$ without a finite subcover. i.e., every finite subfamily $\{A_{\lambda_i} \mid i = 1, 2, ..., n\}$ is such that $\bigvee_{i=1}^{n} A_{\lambda_i} \neq 1_X$ $\Rightarrow$ $\bigwedge_{i=1}^{n} A_{\lambda_i} \neq 0_X$ $\Rightarrow$ $\{A_\lambda \mid \lambda \in \Lambda\}$ forms a fuzzy filterbase of fuzzy weakly-open sets.

Conversely, assume $X$ contains at least one fuzzy filterbase of fuzzy weakly-closed sets in $X$. If possible, let $X$ be fuzzy weakly-compact. So, every fuzzy weakly-open cover of $X$, say $\{A_\lambda \mid \lambda \in \Lambda\}$, has a finite subcover. i.e., $\bigvee_{\lambda \in \Lambda} A_\lambda = 1_X$ $\Rightarrow$ $\bigwedge_{\lambda \in \Lambda} A_\lambda = 0_X$ for every collection of fuzzy weakly-closed sets in $X$, there is at least one subcollection with empty intersection. Therefore, a collection of fuzzy weakly-closed sets cannot form a fuzzy filterbase.

**Theorem IV.6.** An FTS $X$ is fuzzy weakly-compact if for every fuzzy filterbase $\Gamma$ in $X$, $\bigwedge_{\lambda \in \Gamma}(cl(A)) \neq 0_X$.

Proof: If possible, suppose $\{A_\lambda \mid \lambda \in \Lambda\}$ is a fuzzy weakly-open cover of $X$ which does not have a finite subcover. Then for every finite subcollection $\{A_{\lambda_i} \mid i = 1, 2, ..., n\}$, there exists $x \in X$ such that $A_{\lambda_i}(x) < 1$ for each $i = 1, 2, ..., n$. Then $\bigwedge_{i=1}^{n} A_{\lambda_i} = 0_X$ $\Rightarrow$ $\bigwedge_{\lambda \in \Lambda} A_\lambda = 0_X$ forms a fuzzy filterbase of fuzzy weakly-closed sets in $X$.

Since $\{A_\lambda \mid \lambda \in \Lambda\}$ is fuzzy weakly-open cover of $X$, $\bigwedge_{\lambda \in \Lambda} G_\lambda(x) = 1$ for every $x \in X$ and hence $\bigwedge_{\lambda \in \Lambda} A_\lambda(x) = 0 \Rightarrow \bigwedge_{\lambda \in \Lambda} (wcl(A_\lambda))(x) = 0$, a contradiction. Hence $X$ is fuzzy weakly-compact.

**Theorem IV.7.** If an FTS $X$ is fuzzy weakly-compact then for every fuzzy filterbase $\Gamma$ of fuzzy weakly-closed sets in $X$, $\bigwedge_{\lambda \in \Gamma}(cl(A)) \neq 0_X$.

Proof: Let $X$ be a weakly-compact FTS. If possible, assume that there exists a filterbase $\Gamma$ of weakly-closed fuzzy sets in $X$ such that $\bigwedge_{\lambda \in \Gamma}(cl(A)) = 0_X$ $\Rightarrow$ $\bigwedge_{\lambda \in \Gamma}(cl(A))^c = 1_X$ $\Rightarrow$ $\{\lambda \mid A \in \Gamma\}$ is a fuzzy weakly-open cover of $X$. Then by definition of fuzzy weakly-compactness, $\exists$ a finite subcollection $\{\lambda_i \mid A \in \Gamma, i = 1, 2, ..., n\}$ such that $\bigwedge_{i=1}^{n} (cl(A))^c_i = 1_X$ $\Rightarrow$ $\bigwedge_{i=1}^{n} A_i = 0_X$, a contradiction. Hence $\bigwedge_{\lambda \in \Gamma}(cl(A)) \neq 0_X$.

**Theorem IV.8.** A fuzzy subset $U$ in an FTS $X$ is fuzzy weakly-compact relative to $X$ iff for every fuzzy filterbase $\Gamma$ of fuzzy weakly-closed sets in $X$, every finite subcollection of $\Gamma$ is quasi coincident with $U$ and $(\bigwedge_{\lambda \in \Gamma} cl(G)) \cap U \neq 0_X$.

Proof: Assume $U$ is not fuzzy weakly-compact relative to $X$, then $\exists$ a fuzzy weakly-open covering $\{A_\lambda \mid \lambda \in \Lambda\}$ of $U$ without any finite subcover.

This implies $\bigwedge_{i=1}^{n} A_{\lambda_i}(x) \neq 0_X$ for some $x \in \text{Supp}(U)$, for every finite subfamily of $\{A_{\lambda_i} \mid i = 1, 2, ..., n\}$. So, $\bigwedge_{i=1}^{n} A_{\lambda_i}(x) = 0_X$ $\Rightarrow$ $\{A_\lambda \mid \lambda \in \Lambda\}$ forms a filterbase of weakly-closed sets in $X$ and $(\bigwedge_{i=1}^{n} A_{\lambda_i}) \cap U = 0_X$. Hence the result.

**Theorem IV.9.** If $U$ is a fuzzy weakly-compact set relative to an FTS $X$ then for every fuzzy filterbase $\Gamma$ of fuzzy weakly-closed sets in $X$, every finite subcollection of $\Gamma$ is quasi coincident with $U$ and $(\bigwedge_{\lambda \in \Gamma} cl(G)) \cap U \neq 0_X$.

Proof: Let $U$ be fuzzy weakly-compact relative to $X$ and $\exists$ a filterbase $\Gamma$ of fuzzy weakly-closed sets in $X$ such that every finite subcollection of $\Gamma$ is quasi coincident with $U$ and $(\bigwedge_{\lambda \in \Gamma} cl(G)) \cap U \neq 0_X$. For all $x \in \text{Supp}(U)$, $(\bigwedge_{\lambda \in \Gamma} cl(G))(x) = 0$.

**Definition IV.10.** An FTS $X$ is said to be fuzzy weakly-closed iff for every family $\{G_\lambda \mid \lambda \in \Lambda\}$ of fuzzy weakly-open sets with $\bigwedge_{\lambda \in \Lambda} G_\lambda(x) = 1$, there exists a finite subfamily $\{G_{\lambda_i} \mid i = 1, 2, ..., n\}$ such that $\bigwedge_{i=1}^{n} wcl(G_{\lambda_i})(x) = 1$ for every $x \in X$.

**Definition IV.11.** A fuzzy set $U$ in an FTS $X$ is said to be fuzzy weakly-closed relative to $X$ iff for every fuzzy set $\{G_\lambda \mid \lambda \in \Lambda\}$ of fuzzy weakly-open sets with $\bigwedge_{\lambda \in \Lambda} G_\lambda(x) = U(x)$, for all $x \in \text{Supp}(U)$, there exists a finite subfamily $\{G_{\lambda_i} \mid i = 1, 2, ..., n\}$...
such that $(\bigvee_{i=1}^{n} wclG_{\lambda_i})(x) = U(x)$, for every $x \in Supp(U)$.

**Remark IV.12.** Every fuzzy weakly-compact space is fuzzy weakly-closed but not conversely.

**Theorem IV.13.** An FTS $X$ is fuzzy weakly-closed if for every fuzzy filterbase $\Gamma$ in $X$, $(\bigwedge_{\Lambda \in \Gamma} wclA) \neq 0_X$.

**Proof:** Let every fuzzy filterbase $\Gamma$ in $X$ be such that $(\bigwedge_{\Lambda \in \Gamma} wclA) \neq 0_X$. If possible, assume $\{G_{\lambda} \mid \lambda \in \Lambda\}$ be a fuzzy weakly-open cover of $X$ and let for every finite subfamily $\{G_{\lambda_i} \mid i = 1, 2, \ldots, n\}$, $(\bigvee_{i=1}^{n} wclG_{\lambda_i})(x) < 1$ for some $x \in X \Rightarrow (\bigwedge_{i=1}^{n} wclG_{\lambda_i})(x) > 0$, for some $x \in X \Rightarrow (wclG_{\lambda_i})^c \mid \lambda \in \Lambda \subseteq \{G_{\lambda_i} \mid i = 1, 2, \ldots, n\}$ forms a fuzzy filterbase in $X$. We have $\bigwedge_{\Lambda \in \Gamma} wclG_{\lambda_i}(x) = 0 \Rightarrow \bigwedge_{\Lambda \in \Gamma} wclG_{\lambda_i}(x) = 0$, a contradiction. Hence $X$ is fuzzy weakly-closed.

**Theorem IV.14.** If an FTS $X$ is fuzzy weakly-closed then for every fuzzy weakly-open filterbase $\Gamma$ in $X$, $(\bigwedge_{G \in \Gamma} cl(G)) \neq 0_X$.

**Proof:** Let $X$ be a fuzzy weakly-closed space, assume there exists a fuzzy weakly-open filterbase $\Gamma$ in $X$ such that $(\bigwedge_{G \in \Gamma} cl(G)) = 0_X \Rightarrow (\bigwedge_{\Lambda \in \Gamma} wclG_{\lambda_i})^c = 1_X \Rightarrow (\bigwedge_{i=1}^{n} (wclG_{\lambda_i}))^c = 0_X \Rightarrow \bigwedge_{\Lambda \in \Gamma} wclG_{\lambda_i} = 0_X$, a contradiction since all $G_i$’s are members of a filterbase. Hence $(\bigwedge_{G \in \Gamma} cl(G)) \neq 0_X$.

**Theorem IV.15.** If a fuzzy subset $U$ in an FTS $X$ is fuzzy weakly-closed relative to $X$ then for every fuzzy weakly-open filterbase $\{G_{\lambda} \mid \lambda \in \Lambda\}$ in $X$ with $(\bigwedge_{\Lambda \in \Gamma} wclG_{\lambda}) \neq 0_X$, there exists a finite subfamily $\{G_{\lambda_i} \mid i = 1, 2, \ldots, n\}$ such that $(\bigwedge_{i=1}^{n} G_{\lambda_i}) \supseteq U$.

**Proof:** Let $U$ be fuzzy weakly-closed relative to $X$ and $\{G_{\lambda} \mid \lambda \in \Lambda\}$ be a fuzzy weakly-open filterbase in $X$, such that for every finite subfamily $\{G_{\lambda} \mid i = 1, 2, \ldots, n\}$ of $\{G_{\lambda} \mid \lambda \in \Lambda\}$, we have $(\bigwedge_{i=1}^{n} G_{\lambda_i}) \supseteq U$ but $(\bigwedge_{G \in \Gamma} cl(G)) \neq 0_X \Rightarrow (\bigwedge_{\Lambda \in \Gamma} wclG_{\lambda_i})(x) = 0$ for every $x \in Supp(U) \Rightarrow (\bigwedge_{\Lambda \in \Gamma} wclG_{\lambda_i})(x) = 1$ for every $x \in Supp(U) \Rightarrow (wclG_{\lambda_i})^c \mid \lambda \in \Lambda$ forms a fuzzy weakly-open cover of $U$ and hence there is a finite subfamily $\{G_{\lambda_i}^c \mid i = 1, 2, \ldots, n\}$ such that $\bigvee_{i=1}^{n} (wclG_{\lambda_i})^c \geq U \Rightarrow (\bigwedge_{i=1}^{n} wclG_{\lambda_i})^c \leq U \Rightarrow \bigwedge_{i=1}^{n} G_{\lambda_i} \supseteq U$, a contradiction.

**Theorem IV.16.** A fuzzy subset $U$ in an FTS $X$ is fuzzy weakly-closed relative to $X$ if for every fuzzy filterbase $\{G_{\lambda} \mid \lambda \in \Lambda\}$ in $X$ with $(\bigwedge_{\Lambda \in \Gamma} wclG_{\lambda}) \neq 0_X$, there exists a finite subfamily $\{G_{\lambda_i} \mid i = 1, 2, \ldots, n\}$ such that $(\bigwedge_{i=1}^{n} G_{\lambda_i}) \supseteq U$.

**Proof:** Suppose $U$ satisfies the hypothesis and if possible, let $U$ be not a fuzzy weakly-closed set relative to $X$, then there exists a collection $\{G_{\lambda} \mid \lambda \in \Lambda\}$ of fuzzy weakly-open sets that covers $U$ such that for every finite subfamily $\{G_{\lambda_i} \mid i = 1, 2, \ldots, n\}$ we have $\bigwedge_{i=1}^{n} wclG_{\lambda_i}(x) \leq U(x)$ for some $x \in Supp(U)$ and hence $(\bigwedge_{i=1}^{n} wclG_{\lambda_i})^c \geq U^c(x) \geq 0$ for some $x \in Supp(U)$ which $(\bigwedge_{i=1}^{n} wclG_{\lambda_i})^c \neq 0$ for every finite subfamily of $\{G_{\lambda} \mid \lambda \in \Lambda\}$, otherwise $(\bigwedge_{i=1}^{n} wclG_{\lambda_i})^c \not\supseteq U \Rightarrow U \leq (\bigwedge_{i=1}^{n} wclG_{\lambda_i})^c \not\supseteq U \Rightarrow (\bigwedge_{i=1}^{n} wclG_{\lambda_i})^c < 1_X$ and hence $\bigwedge_{\Lambda \in \Gamma} wclG_{\lambda_i} = 0_X$, a contradiction.

**V. Conclusion**

In this paper, we have introduced fuzzy weakly closed set in an FTS and studied some of its set theoretic properties. We have also examined inter relationship of fuzzy weakly-closed sets and other generalizations of closed sets in FTS. Further, fuzzy compactness and fuzzy closed space are studied through fuzzy weakly closed sets.
