Exact three-wave solutions for high nonlinear form of Benjamin-Bona-Mahony-Burgers equations

Mohammad Taghi Darvishi, Maliheh Najafi and Mohammad Najafi

Abstract—By means of the idea of three-wave method, we obtain some analytic solutions for high nonlinear form of Benjamin-Bona-Mahony-Burgers (shortly BBMB) equations in its bilinear form.

Keywords—Benjamin-Bona-Mahony-Burgers equations, Hirota’s bilinear form, Three-wave method

I. INTRODUCTION

THE generalized Benjamin-Bona-Mahony-Burgers equations has the following form

\[ u_t - u_{txt} - \alpha u_{xx} + \beta u_x + (g(u))_x = 0, \quad (1) \]

where \( u(x, t) \) represents the fluid velocity in the horizontal direction \( x \), \( \alpha \) is a positive constant, \( \beta \in \mathbb{R} \) and \( g(u) \) is a \( C^2 \)-smooth nonlinear function. In the physical sense, equation (1) with the dissipative term \(-\alpha u_{xx}\) is proposed if the good predictive power is desired, such problem arises in the phenomena for both the bore propagation and the water waves. Benjamin-Bona-Mahony-Burgers equations have a special kind of solutions: the solitary waves and the property of existence of a finite number of quantities (with physical interpretation) conserved by the solutions. The temporal decay rates of the solution of (1) and its special cases are studied in a number of works. [1] studied the large-time behavior of the global solutions to the Cauchy problem for (1). [2] used the decomposition method for the numerical solution subject to appropriate initial condition of (1) to consider solitary-wave solutions of generalized BBMB equations. [3] applied variational iteration method and homotopy perturbation methods to derive approximate explicit solutions for a special form of (1). [4] used homotopy analysis method to BBMB equations. [5] concerned (1) for special case \( \alpha = 1 \) and \( \beta = 0 \), in this special case we have the long-wave equation

\[ u_t - u_{xx} + (g(u))_x = 0. \quad (2) \]

\[ u_t + u_{xxx} - 3(uv)_x = 0, \quad (3) \]

\[ u_x = v_y, \]

and presented some exact solutions for it by the Exp-function method. [8] investigated the exponential time decay rate of solutions toward traveling waves for the Cauchy problem of equation (1). In this paper we consider equations (3) and solve it by three-wave method. By this method we obtain some exact solution for equations (3).

This paper is organized as follows: In the following section we have a brief review on the three-wave solution method. In Section III, we apply the three-wave method to obtain some exact solutions of (3). Finally, the paper is concluded in Section IV.

II. THREE-WAVE METHOD

Dai et al. [9], suggested the three-wave method for nonlinear evolution equations. The basic idea of this method applies the Painlevé analysis to make a transformation as

\[ u = T(f) \quad (4) \]

for some new and unknown function \( f \). Then we use this transformation in a high dimensional nonlinear equation of the general form

\[ F(u, u_t, u_x, u_y, u_z, u_{xx}, u_{yy}, u_{zz}, \cdots) = 0, \quad (5) \]

where \( u = u(x, y, t) \) and \( F \) is a polynomial of \( u \) and its derivatives. By substituting (4) in (5), the first one converts into the Hirota’s bilinear form, which it will solve by taking a special form for \( f \) and assuming that the obtained Hirota’s bilinear form has three-wave solutions, then we can specify the unknown function \( f \); cf. [9], [10].

III. SOLUTIONS OF HIGH NONLINEAR FORM OF BENJAMIN-BONA-MAHONY-BURGERS EQUATIONS

In this paper, we investigate explicit formula of solutions of the following high nonlinear form of Benjamin-Bona-Mahony-Burgers (BBMB) equations given in [7]

\[ u_t + u_{xxx} - 3(uv)_x = 0, \quad (6) \]

\[ u_x = v_y, \]

where \( u = u(x, y, t) : \mathbb{R} \times \mathbb{R} \times \mathbb{R}^+ \rightarrow \mathbb{R} \).

To solve (6), we introduce a new dependent variables \( u, v \) by

\[ u = -2(\ln f)_{xy}, \quad v = -2(\ln f)_{xx}, \quad (7) \]

where \( f \) is an unknown real function which will be determined. Substituting equation (7) into equation (6), we have

\[ (D_y D_t + D_y D_x^2) f \cdot f = 0, \quad (8) \]
where the D-operator is defined by

$$\begin{align*}
D_x^n D_y^m D_z^l f(x, y, z, t) &= \left( \frac{\partial}{\partial x} - \frac{\partial}{\partial z} \right)^m \left( \frac{\partial}{\partial y} - \frac{\partial}{\partial z} \right)^l (\frac{\partial}{\partial x} - \frac{\partial}{\partial z})^n f(x, y, z, t) \\
& \left[ f(x_1, y_1, t_1) g(x_2, y_2, t_2) \right],
\end{align*}$$

and the right hand side is computed in

$$x_1 = x_2 = x, \quad y_1 = y_2 = y, \quad t_1 = t_2 = t.$$

Now we suppose the solution of (6) as

$$f(x, \xi, t) = e^{-\xi_1} + \delta_1 \cos(\xi_2) + \delta_2 \cosh(\xi_3) + \delta_3 e^{\xi_1}$$

where

$$\xi_i = a_i x + b_i y + c_i t, \quad i = 1, 2, 3$$

and $a_i, b_i, c_i, \delta_i$ are some constants to be determined later. Substituting equation (9) into equation (8) and equating all coefficients of $\sin(\xi_2), \cos(\xi_2), \sinh(\xi_3)$ and $\cosh(\xi_3)$ to zero, we get the following set of algebraic equations for $a_i, b_i, c_i, \delta_i, \ (i = 1, 2, 3)$

$$\begin{align*}
3a_3^2a_1b_1 + 3b_3c_3 + 3a_1^2b_3a_3 + c_1b_1 + a_1^3b_1 + b_3a_3^3 &= 0, \\
a_1^3b_3 + 3b_3a_3^2a_1 + a_3^2b_1a_3 + 3a_1^2b_3a_3 + b_3c_1 + b_1c_3 &= 0, \\
b_2a_3^2 + c_1b_1 + a_3^2b_2a_2 - b_2c_2 - 3a_2^2a_2b_1 &= 0, \\
b_1c_2 + a_3^2b_1a_2 + b_2c_1 - a_2^2b_1 - a_1^3b_2 - 3b_2a_2^2a_1 &= 0, \\
b_3a_3^2b_2 + b_3a_3^2a_2 + b_2a_3^3 - 3a_2^2b_2a_3 + a_3^3b_2 + b_2a_3^2b_3 + b_3c_3 &= 0, \\
3\delta_3^2a_3b_3c_3 + 16a_3^2b_3c_3 + 4a_3^2b_3c_3 - 3\delta_2^2b_3c_3 &= 0.
\end{align*}$$

Solving the system of equations (11) with the aid of Maple, yields the following cases:

**A. Case 1:**

$$a_1 = a_2 = b_2 = c_1 = c_3 = 0, \quad c_2 = a_3^3$$

for some arbitrary real constants $a_2, \delta_1, \delta_2$ and $\delta_3$. Substitute (12) into (7) with equation (9), we obtain the solution as

$$f(x, y, t) = e^{-\xi_1} + \delta_1 \cos(\xi_2) + \delta_2 \cosh(\xi_3) + \delta_3 e^{\xi_1}$$

and

$$u(x, y, t) = \frac{2\delta_1 \cos(\xi_2) a_3^2}{e^{-\xi_1} + \delta_1 \cos(\xi_2) + \delta_2 \cosh(\xi_3) + \delta_3 e^{\xi_1}} + \frac{2\delta_1^2(\sin(\xi_2))^2 a_2^2}{(e^{-\xi_1} + \delta_1 \cos(\xi_2) + \delta_2 \cosh(\xi_3) + \delta_3 e^{\xi_1})^2}$$

for $\xi_1 = b_1 y, \quad \xi_2 = b_2 y, \quad \xi_3 = a_2 x + a_3^3 t$.

If $\delta_3 > 0$, then we obtain the exact breather cross-kink solution

$$u(x, y, t) = \frac{-2}{\xi_1} \delta_1 \sin(\xi_2) a_2 \left( -2 b_1 \sqrt{\xi_3} \sinh(\xi_1 - \theta) + \delta_2 \sinh(\xi_3) b_2 \right)$$

and

$$v(x, y, t) = \frac{2\delta_1 \cos(\xi_2) a_2^2}{(2 \sqrt{\theta} \cosh(\xi_1 - \theta) + \delta_1 \cos(\xi_2) + \delta_2 \cosh(\xi_3))^2}$$

for $\beta = \frac{1}{2} \ln(-\delta_1)$.

If $\delta_3 < 0$, then we obtain the exact breather cross-kink solution

$$u(x, y, t) = \frac{-2}{\xi_1} \delta_1 \sin(\xi_2) a_2 \left( -2 b_1 \sqrt{\xi_3} \cosh(\xi_1 - \theta) + \delta_2 \sinh(\xi_3) b_2 \right)$$

and

$$v(x, y, t) = \frac{2\delta_1 \cos(\xi_2) a_2^2}{(2 \sqrt{\theta} \sinh(\xi_1 - \theta) + \delta_1 \cos(\xi_2) + \delta_2 \cosh(\xi_3))^2}$$

for $\theta = \frac{1}{2} \ln(-\delta_1)$.

**B. Case 2:**

$$a_1 = -i a_2, \quad a_3 = c_3 = 0, \quad b_1 = i b_2,$$

$$c_1 = -i a_2^2, \quad c_2 = a_2^3, \quad \delta_1 = \frac{\delta_2^2}{4},$$

for some arbitrary real constants $a_2, b_2, \delta_1$ and $\delta_2$. We make the dependent variable transformation as follows

$$a_2 = i A_2, \quad b_2 = i B_2$$

where $A_2$ and $B_2$ are real. Substitute (15) into (7) with (9), we obtain the solution as follows

$$f(x, y, t) = e^{\xi_1} + \delta_1 \cos(\xi_2) + \delta_2 \cosh(\xi_3) + \delta_3 e^{-\xi_1}$$

and

$$u(x, y, t) = \frac{-2}{\xi_1} A_2 B_2 e^{-\xi_1} + \delta_1 \cosh(\xi_2) B_2 A_2 - \delta_3 A_2 B_2 e^{\xi_1}$$

and

$$v(x, y, t) = \frac{2}{\xi_1} \delta_1 D_1 - \frac{1}{\xi_1} \delta_1 e^{\xi_1}$$
where
\[ S_1 = (-A_2 e^{-\xi_1} - \delta_1 \sinh (\xi_2) A_2 + \delta_3 A_2 e^{\xi_1}) \]
and
\[ D_1 = (B_2 e^{-\xi_1} - \delta_1 \sinh (\xi_2) B_2 + \delta_2 \sinh (\xi_3) b_3 - \delta_3 B_2 e^{\xi_1}) \]
also
\[ v(x, y, t) = -2 A_2^2 e^{-\xi_1} + \delta_1 \cosh (\xi_2) A_2^2 - \delta_3 A_2 e^{\xi_1} \]
\[ + 2 \left( -\frac{A_2 e^{-\xi_1} - \delta_1 \sinh (\xi_2) A_2 + \delta_3 A_2 e^{\xi_1}}{e^{-\xi_1} + \delta_1 \cosh (\xi_2) + \delta_2 \cosh (\xi_3) + \delta_3 e^{\xi_1}} \right)^2 \]
for
\[ \xi_1 = A_2 x - B_2 y - A_2^2 t, \quad \delta_3 = \frac{S_1}{D_1} \]
\[ \xi_2 = A_2 x + B_2 y - A_2^2 t, \quad \xi_3 = b_3 y. \]

If \( \delta_3 > 0 \) then we obtain the exact breather cross-kink solution
\[ u(x, y, t) = \frac{-2 A_2 B_2 \sqrt[\theta]{\cosh (\xi_2 - \theta) + \delta_1 \cosh (\xi_2) B_2 A_2}}{2\sqrt[\theta]{\cosh (\xi_2 - \theta) + \delta_1 \cosh (\xi_2) + \delta_2 \cosh (\xi_3) + \delta_3 e^{\xi_1}}} \]
where
\[ S_2 = \left( -2 A_2 \sqrt{\delta_3} \sinh (\xi_2 - \theta) - \delta_1 \sinh (\xi_2) A_2 \right) \]
and
\[ D_2 = \left( 2B_2 \sqrt{\delta_3} \sinh (\xi_2 - \theta) - \delta_1 \sinh (\xi_2) B_2 + \delta_2 \sinh (\xi_3) b_3 \right) \]
also
\[ v(x, y, t) = -2 A_2 B_2 \sqrt[\theta]{\cosh (\xi_2 - \theta) + \delta_1 \cosh (\xi_2) A_2^2} \]
\[ + 2 \left( -\frac{2A_2 B_2 \sqrt{\delta_3} \sinh (\xi_2 - \theta) - \delta_1 \sinh (\xi_2) A_2}{2\sqrt{\delta_3} \cosh (\xi_2 - \theta) + \delta_1 \cosh (\xi_2) + \delta_2 \cosh (\xi_3) + \delta_3 e^{\xi_1}} \right)^2 \]
for
\[ \theta = \frac{1}{2} \ln(-\delta_3). \]

C. Case 3:
\[ a_3 = -a_1, b_3 = b_1, c_3 = -c_1, c_1 = -a_1^3 + 3a_2^2 a_1, \]
\[ c_2 = -a_2 \left( 3a_1^2 - a_2^2 \right), \delta_3 = \frac{a_1 \delta_2^2 - a_2 b_2 \delta_1^2}{4a_1 b_1} \]
for some arbitrary real constants \( a_1, a_2, b_1, b_2, \delta_1 \) and \( \delta_2 \).
Substitute equation (19) into (7) with equation (9), we obtain the solution as
\[ f(x, y, t) = e^{-\xi_1} + \delta_1 \cosh (\xi_2) + \delta_2 \cosh (\xi_3) + \delta_3 e^{\xi_1} \]
and
\[ u(x, y, t) = \frac{-2 a_1 b_2 e^{-\xi_1} - \delta_1 \cosh (\xi_2) b_2 - \delta_2 \cosh (\xi_3) b_1 + a_1 \delta_2 b_1 e^{\xi_1}}{-e^{-\xi_1} + \delta_1 \cosh (\xi_2) + \delta_2 \cosh (\xi_3) + \delta_3 e^{\xi_1}} \]
\[ + \frac{2S_4}{D_4} \left( e^{-\xi_1} + \delta_1 \cosh (\xi_2) + \delta_2 \cosh (\xi_3) + \delta_3 e^{\xi_1} \right)^2 \]
where
\[ S_4 = (-a_1 e^{-\xi_1} + \delta_1 \sinh (\xi_2) a_2 - \delta_2 \sinh (\xi_3) a_1 + \delta_3 a_1 e^{\xi_1}) \]
and
\[ D_4 = (-b_1 e^{-\xi_1} + \delta_1 \sinh (\xi_2) b_2 + \delta_2 \sinh (\xi_3) b_1 + \delta_3 b_1 e^{\xi_1}) \]
also
\[ v(x, y, t) = \frac{-2 a_1 e^{-\xi_1} - \delta_1 \cosh (\xi_2) a_2 + \delta_2 \cosh (\xi_3) a_1 + \delta_3 a_1 e^{\xi_1}}{-e^{-\xi_1} + \delta_1 \cosh (\xi_2) + \delta_2 \cosh (\xi_3) + \delta_3 e^{\xi_1}} \]
\[ + \frac{2S_5}{D_5} \left( e^{-\xi_1} + \delta_1 \cosh (\xi_2) + \delta_2 \cosh (\xi_3) + \delta_3 e^{\xi_1} \right)^2 \]
for
\[ \xi_1 = a_1 x + b_1 y + \left( -a_1^3 + 3a_2^2 a_1 \right) t \]
\[ \xi_2 = -a_2 x - b_2 y + a_2 \left( 3a_1^2 - a_2^2 \right) t \]
\[ \xi_3 = -a_1 x + b_1 y + \left( a_1^3 - 3a_2^2 a_1 \right) t \]
and
\[ \delta_3 = \frac{a_1 \delta_2^2 b_1 - a_2 b_2 \delta_1^2}{4a_1 b_1}. \]

If \( \delta_3 > 0 \) then we obtain the exact breather cross-kink solution
\[ u(x, y, t) = \frac{-2 a_1 b_1 \sqrt{\cosh (\xi_2 - \theta) - \delta_1 \cosh (\xi_2) b_2 + \delta_2 \cosh (\xi_3) b_1 + a_1 \delta_2 b_1 e^{\xi_1}}}{2\sqrt{\cosh (\xi_2 - \theta) + \delta_1 \cosh (\xi_2) + \delta_2 \cosh (\xi_3) + \delta_3 e^{\xi_1}}} \]
\[ + \frac{2S_6}{D_6} \left( \cosh (\xi_2 - \theta) + \delta_1 \cosh (\xi_2) + \delta_2 \cosh (\xi_3) + \delta_3 e^{\xi_1} \right)^2 \]
where
\[ S_6 = \left( -2a_1 \sqrt{\delta_3} \sinh (\xi_1 - \theta) + \delta_1 \sin (\xi_2) a_2 - \delta_2 \sin (\xi_3) a_1 \right) \]

and
\[ D_5 = \left(-2b_1 \sqrt{-3} \sinh(\xi_1 - \theta) + \delta_1 \sin (\xi_2) b_2 + \delta_2 \sinh (\xi_3) b_1 \right) \]
also
\[ v(x, y, t) = -2 \frac{2 a_1^2 \sqrt{-3} \sinh(\xi_1 - \theta) - \delta_1 \sin (\xi_2) a_2 + \delta_2 \cos (\xi_3) a_1}{2 \sqrt{-3} \sinh(\xi_1 - \theta) + \delta_1 \cos (\xi_2) + \delta_2 \cosh (\xi_3)} \]
+ \left( \frac{2 \sqrt{-3} \cosh(\xi_1 - \theta) + \delta_1 \cos (\xi_2) + \delta_2 \cosh (\xi_3)}{2 \sqrt{-3} \sinh(\xi_1 - \theta) + \delta_1 \cos (\xi_2) + \delta_2 \cosh (\xi_3)} \right) S_6 D_6 \]
for \( \theta = \frac{1}{2} \ln(-\delta_3) \).

D. Case 4:

\[ a_1 = a_3, a_2 = i a_3, b_2 = 0, c_1 = -4 a_3^3, \]
\[ c_2 = -4 a_3^3, c_3 = -4 a_3^3 \]
for some arbitrary real constants \( b_1, a_3, \delta_1, \delta_2 \) and \( \delta_3 \). Substitute (25) into (7), and we obtain the solution as follows
\[ f(x, y, t) = e^{-\xi_1} + \delta_1 \cosh (\xi_2) + \delta_2 \cosh (\xi_3) + \delta_3 e^{\xi_1} \]
and
\[ u(x, y, t) = -2 \frac{a_3 b_1 \sqrt{-3} \sinh(\xi_1 - \theta) + \delta_1 \cos (\xi_2) a_2 + \delta_2 \cosh (\xi_3) a_1}{2 \sqrt{-3} \sinh(\xi_1 - \theta) + \delta_1 \cos (\xi_2) + \delta_2 \cosh (\xi_3)} \]
+ \left( \frac{2 \sqrt{-3} \cosh(\xi_1 - \theta) + \delta_1 \cos (\xi_2) + \delta_2 \cosh (\xi_3)}{2 \sqrt{-3} \sinh(\xi_1 - \theta) + \delta_1 \cos (\xi_2) + \delta_2 \cosh (\xi_3)} \right) S_7 D_7 \]
where
\[ S_7 = \left(-a_3^3 \sqrt{-3} - \delta_1 \sin (\xi_2) a_3 - \delta_2 \sinh (\xi_3) a_3 + \delta_3 a_3 \delta_1 e^{\xi_1} \right) \]
and
\[ D_7 = \left(-b_1 e^{-\xi_1} - \delta_2 \sinh (\xi_3) b_3 + \delta_3 b_1 e^{\xi_1} \right) \]
Also
\[ v(x, y, t) = -2 \frac{a_3^2 \sqrt{-3} \sinh(\xi_1 - \theta) + \delta_1 \cos (\xi_2) a_2 + \delta_2 \cosh (\xi_3) a_1}{2 \sqrt{-3} \sinh(\xi_1 - \theta) + \delta_1 \cos (\xi_2) + \delta_2 \cosh (\xi_3)} \]
+ \left( \frac{2 a_3 \sqrt{-3} \cosh(\xi_1 - \theta) + \delta_1 \cos (\xi_2) + \delta_2 \cosh (\xi_3)}{2 \sqrt{-3} \sinh(\xi_1 - \theta) + \delta_1 \cos (\xi_2) + \delta_2 \cosh (\xi_3)} \right) S_8 D_8 \]
where
\[ \delta_8 = \left(-a_3 \sqrt{-3} \sinh(\xi_1 - \theta) - \delta_1 \sin (\xi_2) a_2 - \delta_2 \sinh (\xi_3) a_3 \right) \]
and
\[ D_8 = \left(-b_1 \sqrt{-3} \sinh(\xi_1 - \theta) - \delta_2 \sinh (\xi_3) b_3 \right) \]
also
\[ v(x, y, t) = -2 \frac{a_3 b_1 \sqrt{-3} \sinh(\xi_1 - \theta) + \delta_1 \cos (\xi_2) a_2 + \delta_2 \cosh (\xi_3) a_1}{2 \sqrt{-3} \sinh(\xi_1 - \theta) + \delta_1 \cos (\xi_2) + \delta_2 \cosh (\xi_3)} \]
+ \left( \frac{2 \sqrt{-3} \cosh(\xi_1 - \theta) + \delta_1 \cos (\xi_2) + \delta_2 \cosh (\xi_3)}{2 \sqrt{-3} \sinh(\xi_1 - \theta) + \delta_1 \cos (\xi_2) + \delta_2 \cosh (\xi_3)} \right) S_9 D_9 \]
where
\[ S_9 = \left(-2a_3 \sqrt{-3} \cosh(\xi_1 - \theta) - \delta_1 \sin (\xi_2) a_2 - \delta_2 \sinh (\xi_3) a_3 \right) \]
and
\[ D_9 = \left(-2b_1 \sqrt{-3} \cosh(\xi_1 - \theta) - \delta_2 \sinh (\xi_3) b_3 \right) \]
also
\[ v(x, y, t) = \]
\[ -2a_3 \left( \frac{\sqrt{-\delta_3} \sinh(\xi_1 - \theta) + \delta_1 \cosh(\xi_2) + \delta_2 \cosh(\xi_3)}{2\sqrt{-\delta_3} \sinh(\xi_1 - \theta) + \delta_1 \cosh(\xi_2) + \delta_2 \cosh(\xi_3)} + 2 \left( \frac{-2a_3 \sqrt{-\delta_3} \cosh(\xi_1 - \theta) - \delta_1 \sinh(\xi_2) a_3 - \delta_2 \sinh(\xi_3) a_3}{2\sqrt{-\delta_3} \sinh(\xi_1 - \theta) + \delta_1 \cosh(\xi_2) + \delta_2 \cosh(\xi_3)} \right)^2 \right) \]
for
\[ \theta = \frac{1}{2} \ln(-\delta_3). \]

IV. CONCLUSIONS

In this paper, using the three-wave solution method we obtained some explicit formulas of solutions for the Benjamin-Bona-Mahony-Burgers equations. Three-wave solution method with the aid of a symbolic computation software like Maple or Mathematica is an easy and straightforward method which can be apply to other nonlinear partial differential equations. It must be noted that, all obtained solutions have checked in the Benjamin-Bona-Mahony-Burgers equations. All solutions satisfy in the equations.
